**ETOOS Comprehensive Study Material  
For NEET & AIIMS**

# SOME BASIC CONCEPTS OF CHEMISTRY

*Consider Chemistry among the most useful of sciences, and big with future discoveries for the utility and safety of the human race*

“THOMAS JEFFERSON”

## INTRODUCTION

**I**n this chapter we will study the basic concepts and techniques which will form the base of chemistry and will be useful in every chapter you are going to study. As you already know, chemistry is about the study of matter, so we will study the characteristics, classification and measurement of matter with international system of units and their inter conversions, and how to make precise and accurate scientific calculations. After this we will study about the laws of Chemical Combinations and Dalton's atomic theory and how to deal with calculations involving atoms, molecules, **moles and molar mass**. Also how to determine molecular formula and what is Empirical formula will be discussed in this chapter.

## PHYSICS FOR NEET & AIIMS

### Classification of universe

The whole universe consists of matter and energy. In a chemical reaction neither any mass is destroyed nor any energy is lost. Energy can only be transformed from one form to another and that we will study in detail later in this chapter. So basically Universe is classified into 2 categories as follows :

- (I) Matter
- (II) Energy

#### (I) Matter

The thing which occupy space and having mass which is feel by our five senses is called as **matter**. It is mainly subdivided on the basis of two kinds of classifications :

- (I) Physical classification
- (II) Chemical classification

#### Physical Classification :

We see different things around us having different shaped, sizes and colors, mass and occupy space, all these things are composed of matter. Depending upon physical and chemical properties matter is classified into following three categories

- (a) Solid
- (b) Liquid
- (c) Gas

##### (a) Solid

A substance is said to be solid if it possesses a definite volume and a definite shape. Constituent particles are tightly packed and usually there is a regular pattern among the particles and they do not have much freedom to move or not easily compressible.

Ex. sugar, iron, gold, wood, NaCl etc.

##### (b) Liquid

A substance is said to be liquid if it possesses a definite volume but not definite shape. They take up the shape of the vessel in which they are put. The intermolecular distance is high as compared to solids and thus they have the tendency to flow but they are not much compressible due to little free space but can flow easily.

Ex. water, milk, oil, mercury, alcohol, Bromine etc.

##### (c) Gas

A substance is said to be gas if it neither possesses a definite volume nor a definite shape. This is because they fill up the whole vessel in which they are put. The intermolecular distance is highest in gases and are highly compressible.

Ex. hydrogen( $H_2$ ), oxygen( $O_2$ ), carbon dioxide( $CO_2$ ), etc.

Solid, Liquid and Gaseous states of matter are inter convertible by changing temperature and pressure.

For example, water can be converted into ice and water vapour as follows :

**ETOOS KEY POINTS**

Direct conversion of solid to gaseous state is called as **sublimation**. Champhor undergoes sublimation. Also further on applying pressure at a particular temperature gases can be liquified, this principle is applied to compress natural gas and petroleum gas which are available for our uses as CNG and LPG.

**Chemical Classification :**

At the macroscopic level depending upon the composition, matter can also be divided into two broad categories :

- (a) Pure Substance
- (b) Mixture

**(a) Pure Substance**

A material containing only one type of substance. They have fixed composition and their properties also do not vary. Pure Substance can not be separated into simpler substance by physical method.

Ex. Element = Na, Mg, Ca ..... etc.  
 Compound = HCl, H<sub>2</sub>O, CO<sub>2</sub>, HNO<sub>3</sub> ..... etc.

**2 Types**

- (i) Element
- (ii) Compound

(i) **Element** : The pure substance containing only one kind of atoms .

**3 Types (depend on physical and chemical property)**

- Metal
- Non-metal
- Metalloids

**(ii) Compound**

It is defined as pure substance containing more than one kind of atoms which are combined together in a fixed ratio by weight and which can be decomposed into simpler substance by the suitable chemical method. The properties of a compound are different from those of its components.

Ex. H<sub>2</sub>O , HCl, HNO<sub>3</sub> ..... etc.  
 2 : 16  
 1 : 8 by wt.

Compounds are further classified into two categories :

- Organic Compound
- Inorganic Compound

**(b) Mixture**

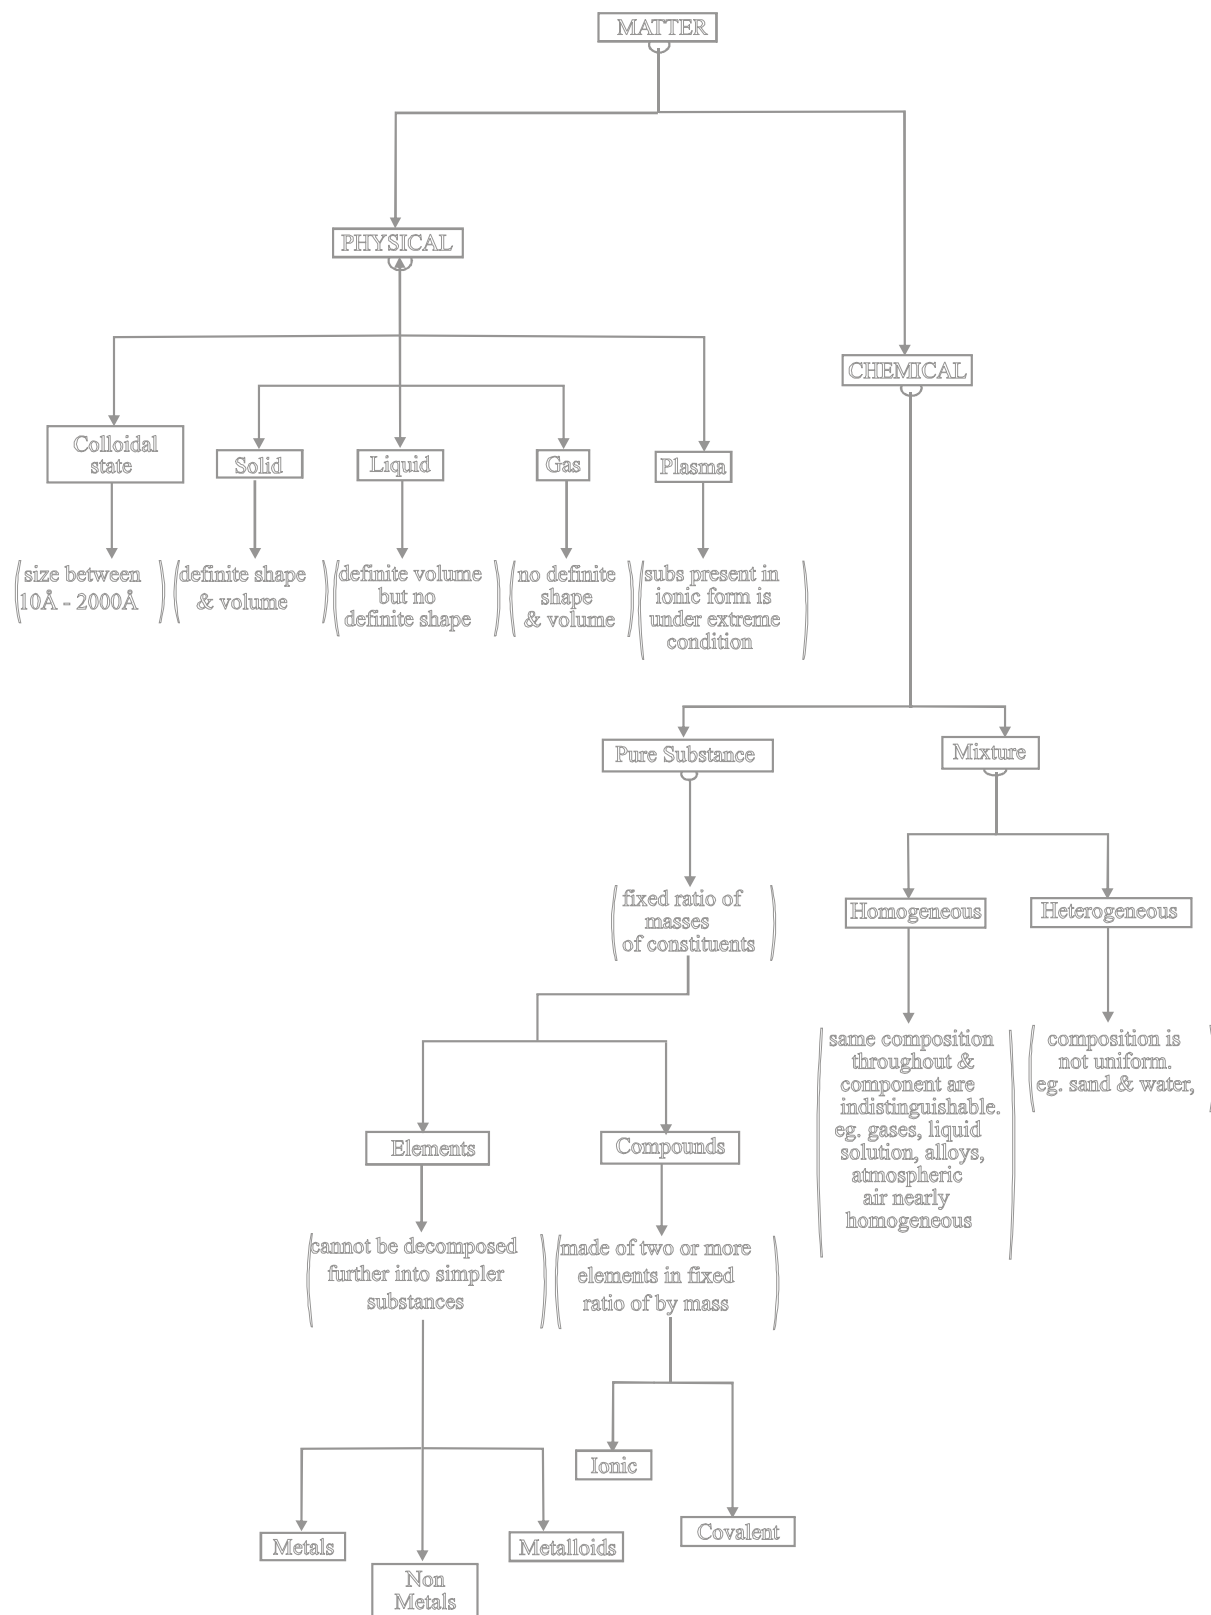

A material which contain more than one type of substances and which is mixed any ratio by wt. i.e the components of a mixture have variable composition. The property of the mixture is the property of its components. The mixture can be separated by simple physical method. Depending upon the composition mixtures are of two types :

- (i) Homogeneous mixture
- (ii) Hetrogeneous mixture
- (i) Homogeneous Mixture

The mixture, in which all the components are present in **uniform** is called as homogeneous mixture.

Ex. Water + Salt, Water + Sugar, Water + alcohol, Air gasoline, brass etc.

*Etoos Tips & Formulas*

**SOLVED EXAMPLE**

**Ex. 1** Show that in the reaction  

$$\text{N}_2(\text{g}) + 3\text{H}_2(\text{g}) \rightarrow 2\text{NH}_3(\text{g}),$$
 mass is conserved.

**Sol.**

$\text{N}_2(\text{g}) + 3\text{H}_2(\text{g}) \rightarrow 2\text{NH}_3(\text{g})$			
moles before reaction	1	3	0
moles after reaction	0	0	2
Mass before reaction = mass of 1 mole $\text{N}_2(\text{g})$ +			
mass of 3 mole $\text{H}_2(\text{g})$			
$= 14 \times 2 + 3 \times 2 = 34 \text{ g}$			
mass after reaction = mass of 2 mole $\text{NH}_3$			
$= 2 \times 17 = 34 \text{ g}$			

**Ex. 2** Find the density of  $\text{CO}_2(\text{g})$  with respect to  $\text{N}_2\text{O}(\text{g})$ .

**Sol.** 
$$\text{R.D.} = \frac{\text{M.wt. of CO}_2}{\text{M.wt. of N}_2\text{O}} = \frac{44}{44} = 1.$$

**Ex. 3** Find the vapour density of  $\text{N}_2\text{O}_5$

**Sol.** 
$$\text{V.D.} = \frac{\text{Mol. wt. of N}_2\text{O}_5}{2} = 54.$$

**Ex. 4** Write a balance chemical equation for following reaction :

When ammonia ( $\text{NH}_3$ ) decompose into nitrogen ( $\text{N}_2$ ) gas & hydrogen ( $\text{H}_2$ ) gas.

**Sol.** 
$$\text{NH}_3 \rightarrow \frac{1}{2} \text{N}_2 + \frac{3}{2} \text{H}_2 \text{ or } 2\text{NH}_3 \rightarrow \text{N}_2 + 3\text{H}_2.$$

**Ex. 5** When 170 g  $\text{NH}_3$  ( $M=17$ ) decomposes how many grams of  $\text{N}_2$  &  $\text{H}_2$  is produced.

**Sol.** 
$$\text{NH}_3 \rightarrow \frac{1}{2} \text{N}_2 + \frac{3}{2} \text{H}_2$$

$$\frac{\text{moles of NH}_3}{1} = \frac{\text{moles of N}_2}{1/2} = \frac{\text{moles of H}_2}{3/2}.$$

So moles of  $\text{N}_2 = \frac{1}{2} \times \frac{170}{17} = 5.$

So wt. of  $\text{N}_2 = 5 \times 28 = 140 \text{ g}.$

Similarly moles of  $\text{H}_2 = \frac{3}{2} \times \frac{170}{17} = 15.$

So wt. of  $\text{H}_2 = 15 \times 2 = 30 \text{ g}.$

**Ex. 6** When x gram of a certain metal burnt in 1.5 g oxygen to give 3.0 g of its oxide. 1.20 g of the same metal heated in a steam gave 2.40 g of its oxide. shows the these result illustrate the law of constant or definite proportion

**Sol.** 
$$\text{Wt. of metal} = 3.0 - 1.5 = 1.5 \text{ g}$$
  
 so wt. of metal : wt of oxygen = 1.5 : 1.5 = 1 : 1  
 similarly in second case ,  
 wt. of oxygen = 2.4 – 1.2 = 1.2 g  
 so wt. of metal : wt of oxygen = 1.2 : 1.2 = 1 : 1  
 so these results illustrate the law of constant proportion.

**Ex. 7** Find out % of O & H in  $\text{H}_2\text{O}$  compound.

**Sol.** 
$$\% \text{ of O} = \frac{16}{18} \times 100 = 88.89\%$$

$$\% \text{ of H} = \frac{2}{18} \times 100 = 11.11\%$$

**Ex. 8** Acetylene & butene have empirical formula  $\text{CH}$  &  $\text{CH}_2$  respectively. The molecular mass of acetylene and butene are 26 & 56 respectively deduce their molecular formula.

**Ans.**  $\text{C}_2\text{H}_2$  &  $\text{C}_4\text{H}_8$

**Sol.** 
$$n = \frac{\text{Molecular mass}}{\text{Empirical formula mass}}$$
  
 For Acetylene :

$$n = \frac{26}{13} = 2$$

$\therefore$  Molecular formula =  $\text{C}_2\text{H}_2$

For Butene :

$$n = \frac{56}{14} = 4$$

$\therefore$  Molecular formula =  $\text{C}_4\text{H}_8.$

**Exercise # 1**

**SINGLE OBJECTIVE**

**NEET LEVEL**

1. Which of the following pairs of substances illustrate the law of multiple proportions  
 (A) CO and CO<sub>2</sub>                      (B) H<sub>2</sub>O and D<sub>2</sub>O  
 (C) NaCl and NaBr                    (D) MgO and Mg(OH)<sub>2</sub>
2. 1.0 g of an oxide of A contained 0.5 g of A. 4.0 g of another oxide of A contained 1.6 g of A. The data indicate the law of  
 (A) Reciprocal proportions  
 (B) Constant proportions  
 (C) Conservation of energy  
 (D) Multiple proportions
3. Among the following pairs of compounds, the one that illustrates the law of multiple proportions is  
 (A) NH<sub>3</sub> and NCl<sub>3</sub>                    (B) H<sub>2</sub>S and SO<sub>2</sub>  
 (C) CuO and Cu<sub>2</sub>O                    (D) CS<sub>2</sub> and FeSO<sub>4</sub>
4. The percentage of copper and oxygen in samples of CuO obtained by different methods were found to be the same. This illustrates the law of  
 (A) Constant proportions  
 (B) Conservation of mass  
 (C) Multiple proportions  
 (D) Reciprocal proportions
5. Two samples of lead oxide were separately reduced to metallic lead by heating in a current of hydrogen. The weight of lead from one oxide was half the weight of lead obtained from the other oxide. The data illustrates  
 (A) Law of reciprocal proportions  
 (B) Law of constant proportions  
 (C) Law of multiple proportions  
 (D) Law of equivalent proportions
6. Chemical equation is balanced according to the law of  
 (A) Multiple proportion  
 (B) Reciprocal proportion  
 (C) Conservation of mass  
 (D) Definite proportions
7. Avogadro number is  
 (A) Number of atoms in one gram of element  
 (B) Number of millilitres which one mole of a gaseous substances occupies at NTP  
 (C) Number of molecules present in one gram molecular mass of a substance  
 (D) All of these
8. Which property of an element is always a whole number  
 (A) Atomic weight                      (B) Equivalent weight  
 (C) Atomic number                    (D) Atomic volume
9. Which one of the following properties of an element is not variable  
 (A) Valency                              (B) Atomic weight  
 (C) Equivalent weight                (D) All of these
10. The modern atomic weight scale is based on  
 (A) C<sup>12</sup>                                    (B) O<sup>16</sup>  
 (C) H<sup>1</sup>                                      (D) C<sup>13</sup>
11. 1 amu is equal to  
 (A)  $\frac{1}{12}$  of C-12                      (B)  $\frac{1}{14}$  of O-16  
 (C) 1g of H<sub>2</sub>                              (D)  $1.66 \times 10^{-23}$  kg
12. Sulphur forms the chlorides S<sub>2</sub>Cl<sub>2</sub> and SCl<sub>2</sub>. The equivalent mass of sulphur in SCl<sub>2</sub> is  
 (A) 8 g/mole                              (B) 16 g/mole  
 (C) 64.8 g/mole                        (D) 32 g/mole
13. The sulphate of a metal M contains 9.87% of M. This sulphate is isomorphous with ZnSO<sub>4</sub>.7H<sub>2</sub>O. The atomic weight of M is  
 (A) 40.3                                    (B) 36.3  
 (C) 24.3                                    (D) 11.3
14. When 100 ml of 1 M NaOH solution and 10 ml of 10 N H<sub>2</sub>SO<sub>4</sub> solution are mixed together, the resulting solution will be  
 (A) Alkaline                              (B) Acidic  
 (C) Strongly acidic                      (D) Neutral
15. In chemical scale, the relative mass of the isotopic mixture of oxygen atoms (O<sup>16</sup>, O<sup>17</sup>, O<sup>18</sup>) is assumed to be equal to  
 (A) 16.002                                (B) 16.00  
 (C) 17.00                                 (D) 11.00
16. For preparing 0.1 N solution of a compound from its impure sample of which the percentage purity is known, the weight of the substance required will be  
 (A) More than the theoretical weight  
 (B) Less than the theoretical weight  
 (C) Same as the theoretical weight  
 (D) None of these
17. 1 mol of CH<sub>4</sub> contains  
 (A)  $6.02 \times 10^{23}$  atoms of H  
 (B) 4 g atom of Hydrogen  
 (C)  $1.81 \times 10^{23}$  molecules of CH<sub>4</sub>  
 (D) 3.0 g of carbon

## Exercise # 2

### SINGLE OBJECTIVE

### AIIMS LEVEL

1. Calculate the amount of Ni needed in the Mond's process given below  

$$\text{Ni} + 4\text{CO} \longrightarrow \text{Ni}(\text{CO})_4$$
 If CO used in this process is obtained through a process, in which 6 g of carbon is mixed with 44 g  $\text{CO}_2$ .  
 (A) 14.675 g                      (B) 29 g  
 (C) 58 g                              (D) 28 g
  
2. The mass of 70%  $\text{H}_2\text{SO}_4$  required for neutralisation of 1 mol of NaOH.  
 (A) 49 gm                              (B) 98 gm  
 (C) 70 gm                              (D) 34.3 gm
  
3. In a certain operation 358 g of  $\text{TiCl}_4$  is reacted with 96 g of Mg. Calculate % yield of Ti if 32 g of Ti is actually obtained [At. wt. Ti = 48, Mg = 24]  
 [Hint :  $\frac{358}{190} = 1.88$ ]  
 (A) 35.38%                              (B) 66.6%  
 (C) 100%                              (D) 60%
  
4. 0.5 mole of  $\text{H}_2\text{SO}_4$  is mixed with 0.2 mole of  $\text{Ca}(\text{OH})_2$ . The maximum number of moles of  $\text{CaSO}_4$  formed is  
 (A) 0.2                                      (B) 0.5  
 (C) 0.4                                      (D) 1.5
  
5. Equal weight of 'X' (At. wt. = 36) and 'Y' (At. wt. = 24) are reacted to form the compound  $\text{X}_2\text{Y}_3$ . Then :  
 (A) X is the limiting reagent  
 (B) Y is the limiting reagent  
 (C) No reactant is left over and mass of  $\text{X}_2\text{Y}_3$  formed is double the mass of 'X' taken  
 (D) none of these
  
6. 25.4 g of iodine and 14.2g of chlorine are made to react completely to yield a mixture of  $\text{ICl}$  and  $\text{ICl}_3$ . Calculate the number of moles of  $\text{ICl}$  and  $\text{ICl}_3$  formed.  
 (A) 0.1 mole, 0.1 mole                      (B) 0.1 mole, 0.2 mole  
 (C) 0.5 mole, 0.5 mole                      (D) 0.2 mole, 0.2 mole
  
7. What weights of  $\text{P}_4\text{O}_6$  and  $\text{P}_4\text{O}_{10}$  will be produced by the combustion of 31g of  $\text{P}_4$  in 32g of oxygen leaving no  $\text{P}_4$  and  $\text{O}_2$ .  
 (A) 2.75g, 219.5g                      (B) 27.5g, 35.5g  
 (C) 55g, 71g                              (D) 17.5g, 190.5g
  
8. What weight of  $\text{CaCO}_3$  must be decomposed to produce the sufficient quantity of carbon dioxide to convert 21.2 kg of  $\text{Na}_2\text{CO}_3$  completely in to  $\text{NaHCO}_3$ . [Atomic mass Na = 23, Ca = 40]  

$$\text{CaCO}_3 \longrightarrow \text{CaO} + \text{CO}_2$$

$$\text{Na}_2\text{CO}_3 + \text{CO}_2 + \text{H}_2\text{O} \longrightarrow 2\text{NaHCO}_3$$
 (A) 100 Kg                              (B) 20 Kg  
 (C) 120 Kg                              (D) 30 Kg
  
9. NX is produced by the following step of reactions  

$$\text{M} + \text{X}_2 \longrightarrow \text{MX}_2 ; \quad 3\text{MX}_2 + \text{X}_2 \longrightarrow \text{M}_3\text{X}_8 ; \quad \text{M}_3\text{X}_8 + \text{N}_2\text{CO}_3 \longrightarrow \text{NX} + \text{CO}_2 + \text{M}_3\text{O}_4$$
 How much M (metal) is consumed to produce 206 gm of NX. (Take at wt of M = 56, N=23, X = 80)  
 (A) 42 gm                                      (B) 56 gm  
 (C)  $\frac{14}{3}$  gm                                      (D)  $\frac{7}{4}$  gm
  
10. 0.05 mole of  $\text{LiAlH}_4$  in ether solution was placed in a flask containing 74g (1 mole) of t-butyl alcohol. The product  $\text{LiAlHCl}_2\text{H}_2\text{O}_3$  weighed 12.7 g. If Li atoms are conserved, the percentage yield is :  
 (Li = 7, Al = 27, H = 1, C = 12, O = 16).  
 (A) 25%                                      (B) 75%  
 (C) 100%                                      (D) 15%
  
11. A sample of a mixture of  $\text{CaCl}_2$  and NaCl weighing 4.44 gm was treated to precipitate all the Ca as  $\text{CaCO}_3$ , which was then heated and quantitatively converted to 1.12g of CaO. (At. wt. Ca = 40, Na = 23, Cl = 35.5)  
 (A) Mixture contains 25% NaCl  
 (B) Mixture contains 60%  $\text{CaCl}_2$   
 (C) Mass of  $\text{CaCl}_2$  is 2.22 g  
 (D) Mass of  $\text{CaCl}_2$  1.11 g
  
12. The oxidation states of Sulphur in the anions  $\text{SO}_3^{2-}$ ,  $\text{S}_2\text{O}_4^{2-}$  and  $\text{S}_2\text{O}_6^{2-}$  follow the order :  
 (A)  $\text{S}_2\text{O}_6^{2-} < \text{S}_2\text{O}_4^{2-} < \text{SO}_3^{2-}$   
 (B)  $\text{S}_2\text{O}_4^{2-} < \text{SO}_3^{2-} < \text{S}_2\text{O}_6^{2-}$   
 (C)  $\text{SO}_3^{2-} < \text{S}_2\text{O}_4^{2-} < \text{S}_2\text{O}_6^{2-}$   
 (D)  $\text{S}_2\text{O}_4^{2-} < \text{S}_2\text{O}_6^{2-} < \text{SO}_3^{2-}$
  
13. The oxidation number of Phosphorus in  $\text{Mg}_2\text{P}_2\text{O}_7$  is :  
 (A) +3                                      (B) +2  
 (C) +5                                      (D) -3

**Exercise # 3**

**PART - 1**

**MATRIX MATCH COLUMN**

1. **Column I**  
 (A)  $\text{Zn(s)} + 2\text{HCl(aq)} \rightarrow \text{ZnCl}_2\text{(s)} + \text{H}_2\text{(g)}$   
 above reaction is carried out by taking  
 2 moles each of Zn and HCl  
 (B)  $\text{AgNO}_3\text{(aq)} + \text{HCl(aq)} \rightarrow \text{AgCl(s)} + \text{HNO}_3\text{(g)}$   
 above reaction is carried out by taking  
 170 g  $\text{AgNO}_3$  and 18.25 g HCl (Ag = 108)  
 (C)  $\text{CaCO}_3\text{(s)} \rightarrow \text{CaO(s)} + \text{CO}_2\text{(g)}$   
 100 g  $\text{CaCO}_3$  is decomposed]  
 (D)  $2\text{KClO}_3\text{(s)} \rightarrow 2\text{KCl(s)} + 3\text{O}_2\text{(g)}$   
 2/3 moles of  $\text{KClO}_3$  decomposed
- Column II**  
 (p) 50% of excess reagent left  
 (q) 22.4 L of gas at STP is liberated  
 (r) 1 moles of solid (product) obtained.  
 (s) HCl is the limiting reagent
2. **Column-I**  
 (A) 100 ml of 0.2 M  $\text{AlCl}_3$  solution + 400 ml  
 of 0.1 M HCl solution  
 (B) 50 ml of 0.4 M  $\text{KCl}$  + 50 ml  $\text{H}_2\text{O}$   
 (C) 30 ml of 0.2 M  $\text{K}_2\text{SO}_4$  + 70 ml  $\text{H}_2\text{O}$   
 (D) 200 ml 24.5% (w/v)  $\text{H}_2\text{SO}_4$
- Column-II**  
 (p) Total concentration of cation(s) = 0.12 M  
 (q)  $[\text{SO}_4^{2-}] = 0.06 \text{ M}$   
 (r)  $[\text{SO}_4^{2-}] = 2.5 \text{ M}$   
 (s)  $[\text{Cl}^-] = 0.2 \text{ M}$
3. **Column-I**  
 (A) Molarity  
 (B) Molality  
 (C) Mole fraction  
 (D) Mass %
- Column-II**  
 (p) Dependent on temperature  
 (q)  $\frac{M_A \times n_A}{n_A M_A + n_B M_B} \times 100$   
 (r) Independent of temperature  
 (s)  $\frac{X_A}{X_B M_B} \times 1000$
- Where  $M_A, M_B$  are molar masses,  $n_A, n_B$  are no of moles &  $X_A, X_B$  are mole fractions of solute and solvent respectively.
4. **Column-I**  
 (A) Law of conservation of mass  
 (B) Law of multiple proportion  
 (C) Law of definite proportion  
 (D) Law of reciprocal proportion  
 (E) Gay Lussac's Law
- Column-II**  
 (p)  $\text{CH}_4$  has carbon and hydrogen in 3 : 1 mass ratio.  
 (q) 10 mL  $\text{N}_2$  combines with 30 mL of  $\text{H}_2$  to form  
 20 mL of  $\text{NH}_3$   
 (r) S and  $\text{O}_2$  combine to form  $\text{SO}_2$  and  $\text{SO}_3$   
 (s) In  $\text{H}_2\text{S}$  and  $\text{SO}_2$  mass ratio of H and O w.r.t. sulphur  
 is 1 : 16, hence in  $\text{H}_2\text{O}$ , mass ratio of H and O is 1 : 8.  
 (t) 4.2 g  $\text{MgCO}_3$  gives 2.0 g residue on heating.
5. **Column-I**  
 (A)  $2\text{H}_2 + \text{O}_2 \longrightarrow 2\text{H}_2\text{O}$   
 1g 1g  
 (B)  $3\text{H}_2 + \text{N}_2 \longrightarrow 2\text{NH}_3$   
 1g 1g  
 (C)  $\text{H}_2 + \text{Cl}_2 \longrightarrow 2\text{HCl}$   
 1g 1g  
 (D)  $2\text{H}_2 + \text{C} \longrightarrow \text{CH}_4$   
 1g 1g
- Column-II**  
 (mass of product)  
 (p) 1.028 g  
 (q) 1.333 g  
 (r) 1.125 g  
 (s) 1.214 g

## Exercise # 4

### PART - 1

### PREVIOUS YEAR (NEET/AIPMT)

1. Assuming fully decomposed, the volume of  $\text{CO}_2$  released at STP on heating 9.85 g of  $\text{BaCO}_3$  (at. mass of Ba = 137) will be [CBSE AIPMT 2000]  
 (A) 1.12 L (B) 0.84 L  
 (C) 2.24 L (D) 4.96 L
2. percentage of Se in peroxidase anhydrase enzyme is 0.5% by weight (at. weight = 78.4), then minimum molecular weight of peroxidase anhydrase enzyme is [CBSE AIPMT 2001]  
 (A)  $1.568 \times 10^3$  (B) 15.68  
 (C)  $2.168 \times 10^4$  (D)  $1.568 \times 10^4$
3. Specific volume of cylindrical virus particle is  $6.02 \times 10^{-2}$  cc/g, whose radius and length are  $7\text{\AA}$  and  $10\text{\AA}$  respectively. If  $N_A = 6.023 \times 10^{23}$ , find molecular weight of virus. [CBSE AIPMT 2001]  
 (A) 15.4 kg/mol (B)  $1.54 \times 10^4$  kg/mol  
 (C)  $3.08 \times 10^4$  kg/mol (D)  $3.08 \times 10^3$  kg/mol
4. Which has maximum number of molecules? [CBSE AIPMT 2002]  
 (A) 7 g  $\text{N}_2$  (B) 2 g  $\text{H}_2$   
 (C) 16 g  $\text{NO}_2$  (D) 16 g  $\text{O}_2$
5. In Haber process 30 L of dihydrogen and 30L of dinitrogen were taken for reaction which yielded only 50% of the expected product. What will be the composition of gaseous mixture under the aforesaid condition in the end? [CBSE AIPMT 2003]  
 (A) 20 L ammonia, 10 L nitrogen, 30 L hydrogen  
 (B) 20 L ammonia, 25 L nitrogen, 15 L hydrogen  
 (C) 20 L ammonia, 20 L nitrogen, 20 L hydrogen  
 (D) 10 L ammonia, 25 L nitrogen, 15 L hydrogen
6. The maximum number of molecules are present in [CBSE AIPMT 2004]  
 (A) 15 L of  $\text{H}_2$  gas at STP (B) 5 L of  $\text{N}_2$  gas at STP  
 (C) 0.5 g of  $\text{H}_2$  gas (D) 10 g of  $\text{O}_2$  gas
7. The mass of carbon anode consumed (giving only carbon dioxide) in the production of 270 kg of aluminium metal from bauxite by the Hall process is (at. mass of Al = 27) [CBSE AIPMT 2005]  
 (A) 180 kg (B) 270 kg  
 (C) 540 kg (D) 90 kg
8. The number of moles of  $\text{KMnO}_4$  reduced by one mole of KI in alkaline medium is [CBSE AIMPT 2005]  
 (A) one fifth (B) five  
 (C) one (D) two
9. An element, X has the following isotopic composition :  
 $^{200}\text{X} : 90\%$ ,  $^{199}\text{X} : 8.0\%$ ,  $^{202}\text{X} : 2.0\%$   
 The weighted average atomic mass of the naturally occurring element X is closest to [CBSE AIMPT 2007]  
 (A) 201 u (B) 202 u  
 (C) 199 u (D) 200 u
10. The number of moles of  $\text{KMnO}_4$  that will be needed to react with one mole of sulphite ion in acidic solution is [CBSE AIPMT 2007]  
 (A) 4/5 (B) 2/5  
 (C) 1 (D) 3/5
11. Number of moles of  $\text{MnO}_4^-$  required to oxidise one mole of ferrous oxalate completely in acidic medium will be [CBSE AIPMT 2008]  
 (A) 0.6 mole (B) 0.4 mole  
 (C) 7.5 moles (D) 0.2 mole
12. How many moles of lead (II) chloride will be formed from a reaction between 6.5 g of  $\text{PbO}$  and 3.2 g of  $\text{HCl}$ ? [CBSE AIPMT 2008]  
 (A) 0.044 (B) 0.333  
 (C) 0.011 (D) 0.029
13. What volume of oxygen gas ( $\text{O}_2$ ) measured at  $0^\circ\text{C}$  and 1 atm, is needed to burn completely 1L of propane gas ( $\text{C}_3\text{H}_8$ ) measured under the same conditions? [CBSE AIPMT 2008]  
 (A) 7 L (B) 6 L  
 (C) 5 L (D) 10 L
14. Volume occupied by one molecule of water (density =  $1\text{ g cm}^{-3}$ ) is [CBSE AIPMT 2008]  
 (A)  $9.0 \times 10^{-23}\text{ cm}^3$  (B)  $6.023 \times 10^{-23}\text{ cm}^3$   
 (C)  $3.0 \times 10^{-23}\text{ cm}^3$  (D)  $5.5 \times 10^{-23}\text{ cm}^3$
15. 10 g of hydrogen and 64 g of oxygen were filled in a steel vessel and exploded. Amount of water produced in this reaction will be [CBSE AIMPT 2009]  
 (A) 2 moles (B) 3 moles  
 (C) 4 moles (D) 1 mol
16. The number of atoms in 0.1 mole of a triatomic gas is ( $N_A = 6.023 \times 10^{23}\text{ mol}^{-1}$ ) [CBSE AIPMT 2010]  
 (A)  $6.026 \times 10^{22}$  (B)  $1.806 \times 10^{23}$   
 (C)  $3.600 \times 10^{23}$  (D)  $1.800 \times 10^{22}$

- The charge on 1 gram ions of  $\text{Al}^{3+}$  is : ( $N_A$  = Avogadro number,  $e$  = charge on one electron)
 

(A)  $\frac{1}{27} N_A e$  coulomb      (B)  $\frac{1}{3} \times N_A e$  coulomb      (C)  $\frac{1}{9} \times N_A e$  coulomb      (D)  $3 \times N_A e$  coulomb
- The weight of a molecule of the compound  $\text{C}_{60}\text{H}_{22}$  is :
 

(A)  $1.09 \times 10^{-21}$  g      (B)  $1.24 \times 10^{-21}$  g      (C)  $5.025 \times 10^{-23}$  g      (D)  $16.023 \times 10^{-23}$  g
- 16 g of an ideal gas  $\text{SO}_x$  occupies 5.6 L. at STP. The value of  $x$  is
 

(A)  $x=3$       (B)  $x=2$       (C)  $x=4$       (D) none
- Calculate the molecular formula of compound which contains 20% Ca and 80% Br (by wt.) if molecular weight of compound is 200. (Atomic wt. Ca = 40, Br = 80)
 

(A)  $\text{Ca}_{1/2}\text{Br}$       (B)  $\text{CaBr}_2$       (C)  $\text{CaBr}$       (D)  $\text{Ca}_2\text{Br}$
- A compound possess 8% sulphur by mass. The least molecular mass is :
 

(A) 200      (B) 400      (C) 155      (D) 355
- Equal weight of 'X' (At. wt. = 36) and 'Y' (At. wt. = 24) are reacted to form the compound  $\text{X}_2\text{Y}_3$ . Then :
 

(A) X is the limiting reagent  
 (B) Y is the limiting reagent  
 (C) No reactant is left over and mass of  $\text{X}_2\text{Y}_3$  formed is double the mass of 'X' taken  
 (D) none of these
- The mass of 70%  $\text{H}_2\text{SO}_4$  required for neutralisation of 1 mol of NaOH.
 

(A) 49 gm      (B) 98 gm      (C) 70 gm      (D) 34.3 gm
- What weights of  $\text{P}_4\text{O}_6$  and  $\text{P}_4\text{O}_{10}$  will be produced by the combustion of 31g of  $\text{P}_4$  in 32g of oxygen leaving no  $\text{P}_4$  and  $\text{O}_2$ .
 

(A) 2.75g, 219.5g      (B) 27.5g, 35.5g      (C) 55g, 71g      (D) 17.5g, 190.5g
- $\text{NX}$  is produced by the following step of reactions
 

$\text{M} + \text{X}_2 \longrightarrow \text{M X}_2$  ;     $3\text{M X}_2 + \text{X}_2 \longrightarrow \text{M}_3\text{X}_8$  ;     $\text{M}_3\text{X}_8 + \text{N}_2\text{CO}_3 \longrightarrow \text{NX} + \text{CO}_2 + \text{M}_3\text{O}_4$

How much M (metal) is consumed to produce 206 gm of NX. (Take at wt of M = 56, N=23, X = 80)

(A) 42 gm      (B) 56 gm      (C)  $\frac{14}{3}$  gm      (D)  $\frac{7}{4}$  gm
- In  $\text{FeCr}_2\text{O}_4$ , the oxidation numbers of Fe and Cr are :
 

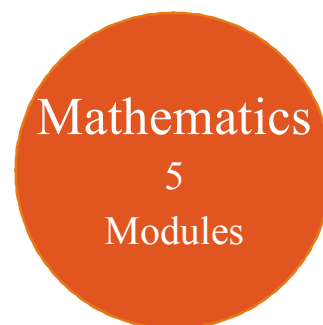

(A) +2 and +3      (B) 0 and +2      (C) +2 and +6      (D) +3 and +6
- The average oxidation state of Fe in  $\text{Fe}_3\text{O}_4$  is :
 

(A) 2 and 3      (B) 8/3      (C) 2      (D) 3
- A solution of  $\text{FeCl}_3$  is  $\frac{M}{30}$  its molarity for  $\text{Cl}^-$  ion will be :
 

(A)  $\frac{M}{90}$       (B)  $\frac{M}{30}$       (C)  $\frac{M}{10}$       (D)  $\frac{M}{5}$
- The molarity of  $\text{Cl}^-$  in an aqueous solution which was (w/V) 2% NaCl, 4%  $\text{CaCl}_2$  and 6%  $\text{NH}_4\text{Cl}$  will be
 

(A) 0.342      (B) 0.721      (C) 1.12      (D) 2.18
